

Content Auto-Poster — Download, Install & Manual

A Claude skill that turns your content bank into a **dated posting schedule** and either

(A) a CSV you bulk-import into a scheduler that auto-posts for you, or **(B)**

direct-publishes Instagram Reels via the Instagram Graph API.

Honest note: Instagram and TikTok only let you publish through their official APIs

or an approved scheduler. There is no key-less "just auto-post" shortcut. This skill

automates everything up to the publish, and (in Mode B) the publish itself once you've

done a one-time token setup.

Part 1 — Download & install the skill

- Download `content-auto-poster.zip` and **unzip** it. You get a folder `content-auto-poster/`.
- Move it into your Claude skills directory:
 - Everywhere on your machine: `~/.claude/skills/content-auto-poster/`
 - One project only: `<project>/.claude/skills/content-auto-poster/`
- Restart Claude Code, type `/`, and `/content-auto-poster` appears.

Requirements: `python3` (the scripts are stdlib-only — nothing to pip install).

For Mode A you need a scheduler account; for Mode B, an Instagram setup (Part 4).

Part 2 — Build your posts list

Create a `posts.json` — a list of posts:

```
\  
posts.json  
  
[  
  
{  
  
  "caption": "Your full caption in your voice ... Comment CLOSER 📌",  
  
  "media": "https://your-cdn.com/reel.mp4",  
  
  "hashtags": "#dmsales #coursecreator",  
  
  "keyword": "CLOSER"  
  
}  
  
]
```

- ```
\
```
- `caption` — the full caption.
  - `media` — a **public https URL** to the video (required for Mode B; for Mode A a URL or a filename your scheduler accepts).
  - `hashtags` — optional.
  - `keyword` — optional; becomes the **first comment** ("Comment CLOSER ...").

Tip: just ask Claude — *"build posts.json from my reel scripts"* — and it fills this in

from your content bank. A sample is at `scripts/posts.sample.json`.

---

## Part 3 — Mode A: schedule + bulk-import (works for everyone)

- Run the schedule builder:

```
\

python3 scripts/schedule-builder.py posts.json \

--start 2026-07-01 --times 09:00,17:00 --days Mon,Tue,Wed,Thu,Fri --out schedule.csv
```

- **--times** = how many per day + when (e.g. two reels/day at 9am & 5pm).
- **--days** = which weekdays to post.
- It writes **schedule.csv** (date, time, caption, first\_comment, media, hashtags) and prints the plan.
- Bulk-import **schedule.csv** into your scheduler:

| Scheduler | Where to import                                        |
|-----------|--------------------------------------------------------|
| Publer    | Create → Bulk → Import CSV                             |
| Metricool | Planning → Import/Autolists (CSV)                      |
| Later     | Bulk Create / CSV upload                               |
| Buffer    | (no native CSV — use Publer/Metricool, or paste posts) |

Map the columns when prompted (date, time, caption, media). Add the **first\_comment** column as the **auto first comment** if your scheduler supports it.

- The scheduler publishes at the scheduled times. **No API token needed.** This is the easiest path and works for **Instagram and TikTok**.

## Part 4 — Mode B: direct-publish to Instagram (optional)

Publishes Reels straight from the script. One-time setup, then it's fully automated.

### 4.1 What you need

- An Instagram **Business or Creator** account, linked to a **Facebook Page**.
- A **Meta (Facebook) developer app** with the Instagram Graph API product.
- A **long-lived access token** with **instagram\_content\_publish** (+ pages permissions).
- Your **IG\_USER\_ID** (the Instagram Business account ID).
- Each video hosted at a **public https URL** (IG pulls the file from there).

### 4.2 Get the token (once)

- Go to **developers.facebook.com** → create an app (type: Business).
- Add the **Instagram Graph API** product; link your Facebook Page + IG account.
- In the **Graph API Explorer**, generate a User token with these permissions:

`instagram_basic`, `instagram_content_publish`, `pages_show_list`,  
`pages_read_engagement`.

- Exchange it for a long-lived token (lasts ~60 days) via the token tool / the

`/oauth/access_token?grant_type=fb_exchange_token` endpoint.

- Find your `IG_USER_ID`: `GET /me/accounts` → your Page → `GET /{page-id}?fields=instagram_business_account`.

(Meta's docs: *Instagram Platform* → *Content Publishing*. The token must be refreshed roughly every 60 days.)

### 4.3 Publish

Set the two env vars, then run per post (try `--dry-run` first):

```
\nexport IG_USER_ID="17841400000000000"\nexport IG_ACCESS_TOKEN="EAAB...your-long-lived-token..."\npython3 scripts/ig_publish.py \\\n--video-url "https://your-cdn.com/reel.mp4" \\\n--caption "Your caption ... Comment CLOSER 📌" \\\n--first-comment "Comment CLOSER and I'll send it 📌" \\\n--share-to-feed
```

The script: creates the reel container → waits for processing → publishes → posts your first comment. It prints the new media ID on success.

### 4.4 Safety

- The token is read from the **environment only** — never store it in `posts.json`, the repo, or a commit.
  - Start with `--dry-run` to confirm the caption/video before going live.
-

---

## Part 5 — TikTok

TikTok's Content Posting API requires **separate app review/approval**, so this skill

**schedules TikTok via the CSV (Mode A)** rather than direct-posting. Import the same

**schedule.csv** into a scheduler that supports TikTok (Publer, Metricool, Later).

---

## Troubleshooting

| Symptom                                   | Fix                                                                         |
|-------------------------------------------|-----------------------------------------------------------------------------|
| <b>set IG_USER_ID and IG_ACCESS_TOKEN</b> | Export both env vars (Part 4.3).                                            |
| HTTP 400 on <b>/media</b>                 | Video URL must be public https + a supported MP4; check the IG_USER_ID.     |
| <b>status: IN_PROGRESS</b> forever        | Large/slow video — the script polls ~3 min; re-run, or host a smaller file. |
| Token expired                             | Long-lived tokens last ~60 days — regenerate (Part 4.2).                    |
| <b>/content-auto-poster</b> not showing   | Open Claude Code inside the folder with <b>.claude/</b> , then restart.     |
| Scheduler won't import CSV                | Use Publer or Metricool (best CSV support); map columns when prompted.      |

---

## Quick start (TL;DR)

- Unzip → **~/ .claude/skills/content-auto-poster/** → restart Claude → **/content-auto-poster** .
- Build **posts.json** (or ask Claude to).
- **schedule-builder.py ... --out schedule.csv** .
- **Easiest:** import **schedule.csv** into Publer/Metricool — done.
- **Or** set up the IG token once and **ig\_publish.py** posts Reels directly.
